

The `ll-core` distribution contains the following modules:

- **`ll.ansistyle`** is a module that enables colored text output via ANSI escape sequences.
- **`ll.color`** handles RGB color values and conversion between different color models.
- **`ll.make`** is an object oriented make replacement.
- **`ll.misc`** contains common functionality used by the other packages.
- **`ll.sisyphus`** is a module that simplifies running Python stuff in cron jobs.
- **`ll.daemon`** is a module that can be used on UNIX to fork a daemon process.
- **`ll.url`**, a module that implements an RFC2396 compatible URL class.
- **`ll.xpit`** is a module that can be used for text templating. You can embed Python expressions in text and these expressions will be evaluated.
